Características generales de los circuitos digitales

ESCALAS DE INTEGRACION DE LOS CIRCUITOS DIGITALES

De acuerdo a su complejidad, los circuitos integrados digitales se clasifican en 4 categorías básicas llamadas SSI, MSI, LSI, y VLSI. Esta clasificación se fundamenta en la cantidad de compuertas utilizadas para implementar la función propia del chip. Como sabemos, las compuertas son los bloques constructivos básicos de todos los circuitos Digitales.

SSI

Significa Small Scale Integration (integración en pequeña escala) y comprende los chips que contienen menos de 13 compuertas. Ejemplos: compuertas y flip-flops. Los CI SSI se fabrican principalmente empleando tecnologías TTL, CMOS y ECL. Los primeros circuitos integrados eran SSI

MSI

Significa Medium Scale Integration (integración en mediana escala) y comprende los chips que contienen de 13 a 100 compuertas. Ejemplos: codificadores, registros, contadores, multiplexores, decodificadores, demultiplexores. Los CI MSI se fabrican empleando tecnologías TTL, CMOS y ECL.

LSI

Significa Large Scale Integration (integración en alta escala) y comprende los chips que contienen de 100 a 1000 compuertas. Ejemplos: memorias, unidades aritméticas y lógicas (ALU's), microprocesadores de 8 y 16 bits. Los CI LSI se fabrican principalmente empleando tecnologías 12L, NMOS y PMOS.

VLSI

Significa Very Large Scale Integration (integración de muy alta escala) y comprende los chips que contienen más de 1000 compuertas. Ejemplos: microprocesadores de 32 bits, microcontroladores, sistemas de adquisición de datos. Los CI VLSI se fabrican también empleando tecnologías 12L, NMOS y PMOS.

FAMILIAS LOGICAS DE LOS CIRCUITOS INTEGRADOS

Una familia lógica es un conjunto de componentes digitales que comparten una tecnología común de Fabricación y tienen estandarizadas sus características de entrada y salida; es decir, son compatibles unos con otros.

Como consecuencia de la estandarización, la interconexión entre dispositivos lógicos de una misma familia es particularmente sencilla y directa: no requiere de etapas adicionales de acoplamiento.

CARACTERISTICAS GENERALES DE LAS FAMILIAS LÓGICAS

Todas las familias o tecnologías de fabricación de circuitos integrados digitales se agrupan en dos categorías generales: bipolares y MOS. Las características más relevantes de un circuito integrado digital con su velocidad, su consumo de potencia, su inmunidad al ruido y su confiabilidad. A continuación se definen estos términos, desde un punto de vista general.

La Velocidad

Mide la rapidez de respuesta de las salidas de un circuito digital a cualquier cambio en sus entradas. La velocidad es una consideración importante en el diseño de sistemas que deben realizar cálculos numéricos o en circuitos que trabajan con señales de alta frecuencia.

El consumo de potencia mide la cantidad de corriente o de potencia que consume un circuito digital en operación. El consumo de potencia es una consideración importante en el diseño de sistemas operados por baterías

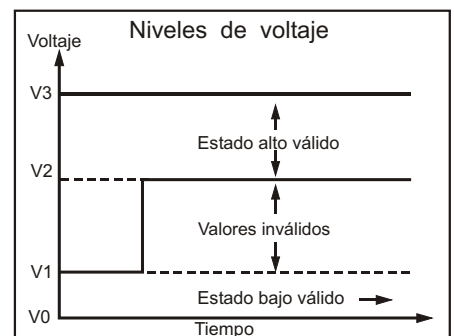

La inmunidad al ruido

Mide la sensibilidad de un circuito digital al ruido electromagnético ambiental. La inmunidad al ruido es una consideración importante en el diseño de sistemas que deben trabajar en ambientes ruidosos como automóviles, máquinas, circuitos de control industrial, etc.

La confiabilidad

Mide el período útil de servicio de un circuito digital, es decir, cuánto tiempo se espera que trabaje sin fallar

Niveles de voltaje y estados lógicos
En todos los circuitos digitales prácticos los estados lógicos 1 y 0 se implementan con niveles de voltaje. Estos niveles tienen rangos muy definidos, separados por una zona de valores inválidos como se muestra en la figura siguiente

En esta figura, el nivel bajo válido es el rango de voltajes entre V0 y V1, mientras que el nivel alto válido es el rango de voltajes entre V2 y V3.

Los voltajes superiores a V3 ó inferiores a V0 son generalmente dañinos para los dispositivos digitales y deben evitarse. Generalmente, V0 corresponde a un nivel de 0 voltios y V3 al valor del voltaje de alimentación (5V, 9V, etc.).

La zona de niveles inválidos entre V1 y V2 es crítica. En esta área los circuitos digitales trabajan en forma errática porque no saben qué hacer. Un voltaje en ese rango puede ser interpretado como un 1 lógico o como un 0 lógico o no producir efectos alguno. Los niveles de voltaje en circuitos integrados digitales varían de acuerdo con la familia lógica (TTL o CMOS) a la que pertenece el dispositivo.

Como hemos visto anteriormente en la tabla anterior hay muchas familias lógicas en las cuales se diferencian por las características anteriores mencionadas pero que en este estudio veremos dos de las familias mas utilizadas y mas conocidas por su versatilidad y por su comodidad en el manejo de ellas mismas, las cuales son los TTL y los CMOS.

LA FAMILIA DE LOS TTL

La familia lógica TTL es quizás la más antigua y común de todas las familias lógicas de circuitos integrados digitales. La mayor parte de los chips SSI y MSI se fabrican utilizando tecnología TTL.

Los circuitos integrados TTL implementan su lógica interna, exclusivamente, a base de transistores NPN y PNP, diodos y resistencias.

La primera serie de dispositivos digitales TTL fue lanzada por Texas Instruments en 1964. Los chips TTL se usan en toda clase de aplicaciones digitales, desde el más sencillo computador personal hasta el más sofisticado robot industrial. Los circuitos TTL son rápidos, versátiles y muy económicos.

La familia TTL esta disponible en dos versiones: la serie 54 y la serie 74. La primera se destina a las aplicaciones militares y la segunda a aplicaciones industriales y de propósito general. Los dispositivos de la serie 54 tienen rangos de operación de temperatura y voltaje más flexible (desde -55 hasta 125°C contra 0 a 70°C de la serie 74).

La familia TTL., o bipolar se divide en las siguientes Categorías o subfamilias básicas:

TTL STANDART

TTL SHOTTKY (S)

TTL DE BAJA POTENCIA (L)

TTL SHOTTKY DE BAJA POTENCIA (LS)

TTL DE ALTA VELOCIDAD (H)

TTL SHOTTKY AVANZAD (AS)

TTL SHOTTKY DE BAJA POTENCIA AVANZADA(ALS)

Otra familia bipolar muy popular es la ECL (Lógica de emisor acoplado). Los dispositivos de esta familia se caracterizan por su rapidez, pero consumen mucha potencia, son costosos y su manufactura es relativamente compleja. Su uso se limita a aplicaciones de muy alta velocidad.

TTL estandard

Estándar La familia estándar comprende principalmente los dispositivos que se designan como 74xx (7400, 7447, etc.). 74xxx (74123, 74193, etc.), 8xxx (8370, 8552, etc.) Y 96xx (9601, 9615, etc.). Trataremos con preferencia la 1° series 74xx y 74xxx que son las más utilizadas en los circuitos modernos.

Existe una gran cantidad de funciones lógicas que se realizan con esta tecnología. Entre las principales tenemos: compuertas, decodificadores, contadores, flip flop, sumadores, multiplexores y muchas otras que estudiaremos mas adelante.

Características de los circuitos integrados TTL

Las características que más se notan de los circuitos integrados de la familia TTL, estándar son, los siguientes:

Alta velocidad de operación. Pueden trabajar con frecuencias de 18 a 20 Mhz y en algunas veces hasta 80 Mhz. La velocidadoperación se expresa casi siempre en términos del tiempo o retardo de propagación del CI.

El tiempo o retardo de propagación de un circuito digital es el tiempo que toma un cambio lógico en la entrada en propagarse a través del dispositivo y producir un cambio lógico en la salida.

Los tiempos de propagación en TTL normalmente del orden de 2 a 30 nanosegundos por compuerta.

Alta disipación de potencia. Es una desventaja asociada con la alta velocidad de operación. En general, cuanto más rápido sea un circuito, más potencia consume y viceversa. La mayoría de los circuitos TTL disipan típicamente, de 1 a 25 milivatios por compuerta.

Tensión de alimentación nominal de +5V. Los circuitos TTL en general pueden operar con tensiones de CC entre 4.75 y 5.25 V pero el valor nominal de la tensión de trabajo es +5 V. Por esta razón, los aparatos que incluyen circuitos integrados TTL se deben alimentar con una fuente regulada de 5 voltios.

Niveles de voltaje de 0 a 0.08 V para el estado bajo y de 2.4 a 5.0 V para el estado alto. En general, los circuitos TTL interpretan cualquier voltaje entre 0 y 0.8V como un cero (0) lógico o bajo y cualquier voltaje entre 2.4 y 5V como un (1) lógico o alto.

El máximo voltaje positivo que puede aplicarse a una entrada TTL es +5.5V y el máximo negativo es -0.5V. Al excederse estos parametros, los dispositivos TTL generalmente se destruyen.

Abanicos de entrada (fan-in) y de salida (fan-out)

La familia TTL utiliza a dos parámetros para determinar cuántos dispositivos TTL se pueden conectar entre sí. Estos parámetros se denominan abanico de entrada (fan-in).

El fan-in mide el efecto de carga que presenta una entrada a una salida. Cada entrada de un circuito TTL estándar se comporta como una fuente de corriente capaz de suministrar 1.8 mA. A este valor de corriente se le asigna un fan-in de 1.

El fan-out mide la capacidad de una salida de manejar una o más entradas. Cada salida de un circuito TTL estándar se comporta como un disipador de corriente capaz de aceptar hasta 18 mA, es decir de manejar hasta 10 entradas TTL estándares. Por tanto, el fan-out de una salida TTL estándar es 10.

Existen dispositivos TTL especiales llamados buffers (separadores) y drivers (manejadores) que tienen fan-outs de 30, 50 o incluso 100. Se utilizan en aplicaciones donde una determinada línea de salida debe manejar al mismo tiempo un gran número de líneas de entrada. Los buffers y drivers se estudian en detalle en las lecciones 6 y 8.

Otros circuitos integrados TTL

Existen varias series o subfamilias TTL, además de la serie TTL estándar 74. Cada una de estas subfamilias posee características propias que las hacen adecuadas para aplicaciones o necesidades muy específicas. Las más conocidas son:

TTL de baja potencia. Comprenden los dispositivos designados como 74L00, 74L04. Consumen 10 veces menos potencia que los dispositivos TTL estándares correspondientes pero son 4 veces más lentos.

TTL de alta velocidad. Comprende los dispositivos designados como 74Hxx y 74Hxxx; por ejemplo: 74H05, 74H123. Consumen 2.5 veces más potencia que los dispositivos TTL estándares pero son 2 veces más rápidos.

TTL Shottky. Comprende los dispositivos designados como 74Sxx y 74Sxxx; por ejemplo 74S181, 74S11. Consumen 1.8 veces más potencia que los dispositivos TTL estándares pero son 4 veces más rápidos.

TTL Shottky de baja potencia. Comprende los dispositivos designados como 74LSxx 74LSxxx (74LS83, 74LS221, etc.). Consumen 5 veces menos potencia que los dispositivos TTL estándares y son igual de rápidos. Esta es la subfamilia más utilizada entre todas las divisiones de la familia TTL.

TTL Shottky avanzada de baja potencia. Comprende los dispositivos designados como 74ALSxx y 74ALSxxx; por ejemplo: 74ALS00, 74ALS73. Consumen la mitad de la potencia requerida por los dispositivos LS equivalentes y son el doble de rápidos.

TTL Shottky avanzada. Comprende los dispositivos designados como 74ASxx y 74ASxxx; por ejemplo 74AS00, 74AS73. Proporciona los más cortos tiempos de propagación que el estado actual de la tecnología bipolar puede ofrecer y su consumo es intermedio entre TTL estándar y LS.

ABREVIATURAS TÍPICAS DE LOS INTEGRADOS

H	= NIVEL LOGICO ALTO (ESTABLE)
L	= NIVEL LOGICO BAJO (ESTABLE)
↑	= FLANCO DE SUBIDA (paso de nivel lógico bajo a nivel alto)
↓	= FLANCO DE BAJADA (paso de nivel lógico alto a nivel alto)

Diag. 160 16-Pin DIP See Fig. D8
ECG74195, ECG74LS195A

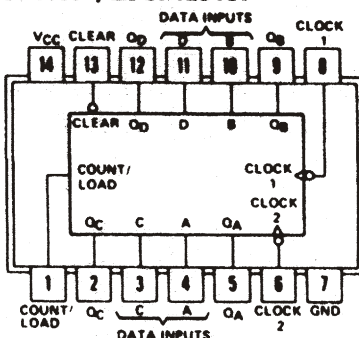

4-Bit Parallel Shift Register with Complementary Final Stage

Diag. 161 14-Pin DIP See Fig. D6
ECG74196, ECG74LS196

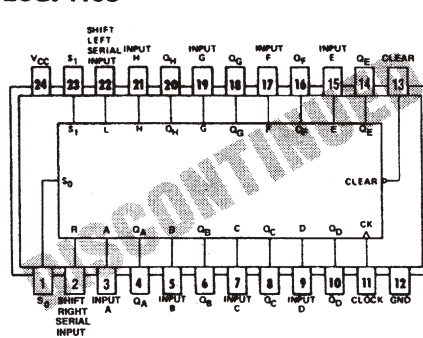

Presettable Decade Counter/Latch

Diag. 162 14-Pin DIP See Fig. D6
ECG74197*, ECG74LS197

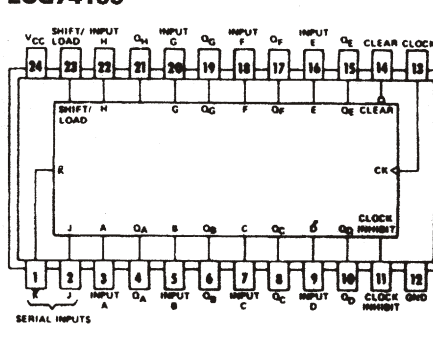

Presettable 4-Bit Binary Counter/Latch * DISCONTINUED

Diag. 163 24-Pin DIP See Fig. D15
ECG74198

8-Bit Bidirectional Parallel Shift Register

Diag. 164 24-Pin DIP See Fig. D15
ECG74199

8-Bit Serial or Parallel-In/Parallel-Out Shift Register

Diag. 165 16-Pin DIP See Fig. D8
ECG74221, ECG74C221, ECG74LS221

Dual Monostable Multivibrator

Diag. 166 20-Pin DIP See Fig. D12
ECG74C240, ECG74HC240,
ECG74HCT240*, ECG74LS240

Octal Buffer/Line Driver/Line Receiver with Inverting 3-State Output * DISCONTINUED

Diag. 167 20-Pin DIP See Fig. D12
ECG74LS241

Octal Buffer/Line Driver/Line Receiver with Non-Inverting 3-State Output

TTL Logic Diagrams (cont'd)

Diag. 168 14-Pin DIP See Fig. D6
ECG74LS242

Quad Bus Transceiver with Inverting 3-State Output

Diag. 169 14-Pin DIP See Fig. D6
ECG74LS243

Quad Bus Transceiver with Non-Inverting 3-State Output

Diag. 170 20-Pin DIP See Fig. D12
ECG74HC244, ECG74HC244, ECG74HCT244, ECG74LS244

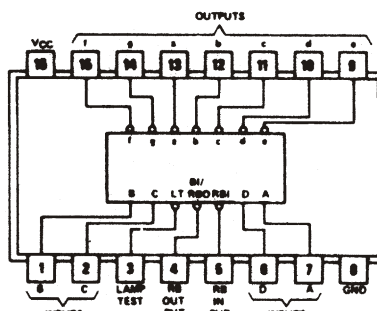

Octal Buffer/Line Driver/Line Receiver with Non-Inverting 3-State Output

Diag. 171 20-Pin DIP See Fig. D12
ECG74LS245

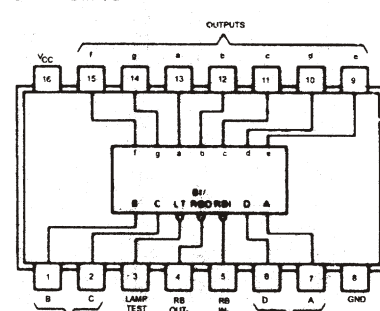

Octal Bus Transceiver with Non-Inverting 3-State Output

Diag. 172 16-Pin DIP See Fig. D8
ECG74LS247

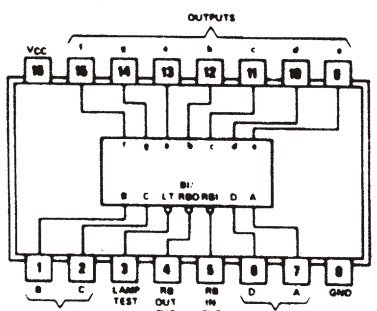

BCD-to-7-Segment Decoder/Driver with Hi-Volt (15 V) Open Collector Output

Diag. 173 16-Pin DIP See Fig. D8
ECG74LS248

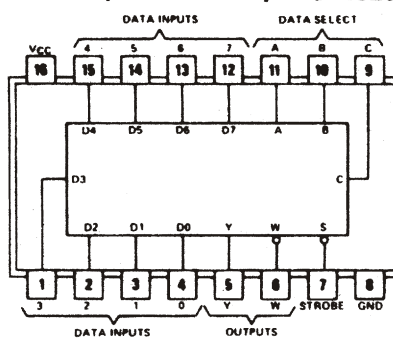

BCD-to-7-Segment Decoder/Driver

Diag. 174 16-Pin DIP See Fig. D8
ECG74249, ECG74LS249

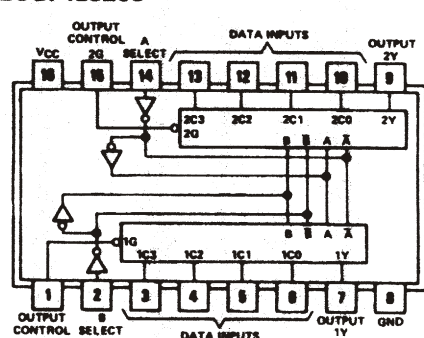

BCD-to-7-Segment Decoder/Driver with Open Collector Output

Diag. 175 16-Pin DIP See Fig. D8
ECG74251, ECG74LS251, ECG74S251

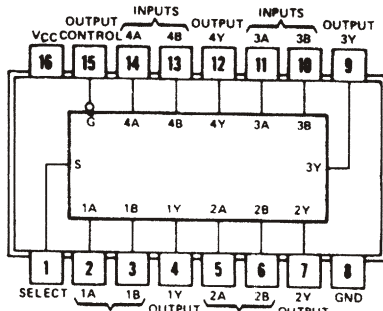

8-Line-to-1-Line Data Selector/Multiplexer with Complementary 3-State Output

Diag. 176 16-Pin DIP See Fig. D8
ECG74LS253

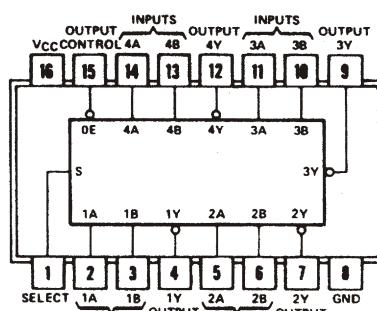

Dual-4 Line-to-1-Line Data Selector/Multiplexer with 3-State Output

Diag. 177 16-Pin DIP See Fig. D8
ECG74HC257, ECG74LS257

Quad 2-Line-to-1-Line Data Selector/Multiplexer with 3-State Output

Diag. 178 16-Pin DIP See Fig. D8
ECG74LS258, ECG74S258

Quad 2-Line-to-1-Line Data Selector/Multiplexer with Inverting 3-State Output

Diag. 179 16-Pin DIP See Fig. D8
ECG74HC259, ECG74LS259

8-Bit Addressable Latch

TTL Logic Diagrams (cont'd)

Diag. 180 14-Pin DIP See Fig. D6
ECG74LS260

Dual 5-Input NOR Gate

Diag. 181 14-Pin DIP See Fig. D6
ECG74LS266

Quad Exclusive NOR Gate with Open Collector Output

Diag. 182 20-Pin DIP See Fig. D12
ECG74HC273, ECG74HCT273, ECG74LS273

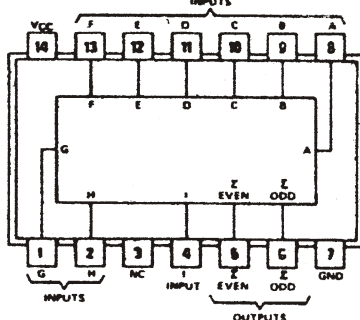

Octal "D" Flip-Flop with Clear

Diag. 183 16-Pin DIP See Fig. D8
ECG74LS279

Quad \bar{S} - \bar{R} Latch

Diag. 184 14-Pin DIP See Fig. D6
ECG74LS280

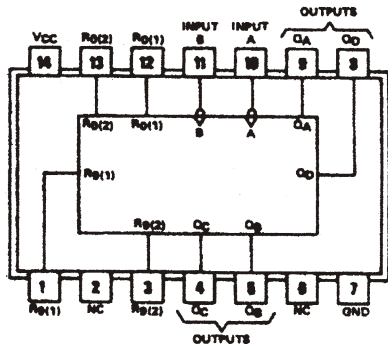

9-Bit Odd/Even Parity Generator/Checker

Diag. 185 16-Pin DIP See Fig. D8
ECG74LS283

4-Bit Full Adder

Diag. 186 14-Pin DIP See Fig. D6
ECG74290, ECG74LS290

Decade Counter

Diag. 187 14-Pin DIP See Fig. D6
ECG74LS293

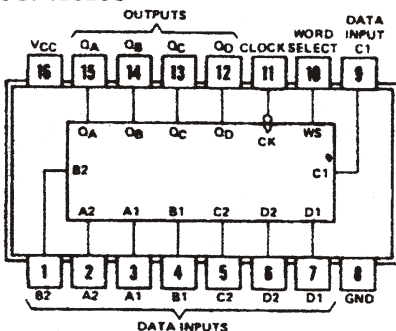

4-Bit Binary Counter

Diag. 188 14-Pin DIP See Fig. D6
ECG74LS295A

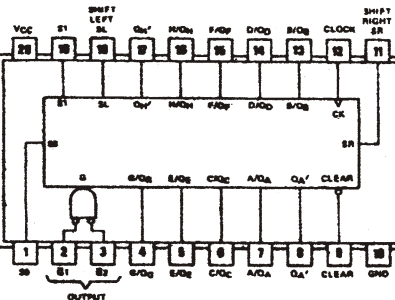

4-Bit Bidirectional Parallel Shift Register with 3-State Output

Diag. 189 16-Pin DIP See Fig. D8
ECG74LS298

Quad 2-Input Multiplexer with Storage

Diag. 190 20-Pin DIP See Fig. D12
ECG74HC299, ECG74LS299

8-Bit Bidirectional Shift/Storage Register with 3-State Output

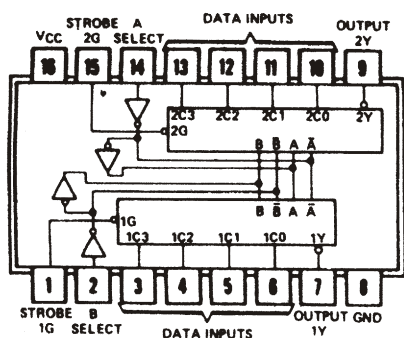

Diag. 191 16-Pin DIP See Fig. D8
ECG74LS348

8-Line-to-3-Line Priority Encoder with 3-State Output

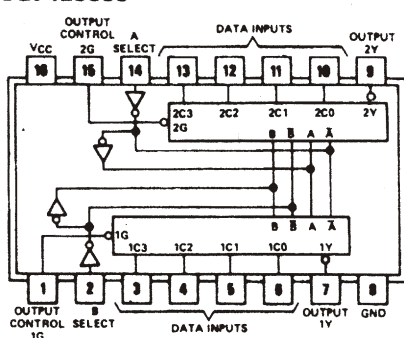

TTL Logic Diagrams (cont'd)

Diag. 192 16-Pin DIP See Fig. D8
ECG74LS352

Dual 4-Line-to-1-Line Data Selector/
Multiplexer with 3-State Output

Diag. 193 16-Pin DIP See Fig. D8
ECG74LS353

Dual 4-Line-to-1-Line Data Selector/
Multiplexer with Inverting 3-State Output

Diag. 194 20-Pin DIP See Fig. D12
ECG74LS363

Octal "D" Transparent Latch with 3-State
Output

Diag. 195 20-Pin DIP See Fig. D12
ECG74LS364

Octal "D" Flip-Flop with 3-State Output

Diag. 196 16-Pin DIP See Fig. D8
ECG74365, ECG74LS365A

Hex Bus Driver with Non-Inverting 3-State
Output (Common Enable)

Diag. 197 16-Pin DIP See Fig. D8
ECG74366, ECG74LS366A

Hex Bus Driver with Inverting 3-State
Output (Common Enable)

Diag. 198 16-Pin DIP See Fig. D8
ECG74367, ECG74LS367

Hex Bus Driver with Non-Inverting 3-State
Output (4-Line/2-Line Enable)

Diag. 199 16-Pin DIP See Fig. D8
ECG74368, ECG74LS368

Hex Bus Driver with Inverting 3-State
Output (4-Line/2-Line Enable)

Diag. 200 20-Pin DIP See Fig. D12
**ECG74C373, ECG74HC373,
ECG74HCT373, ECG74HC573,
ECG74HCT573, ECG74LS373**

Octal "D" Transparent Latch with 3-State
Output

Diag. 201 20-Pin DIP See Fig. D12
**ECG74C374, ECG74HC374,
ECG74HCT374, ECG74HC574,
ECG74HCT574*, ECG74LS374**

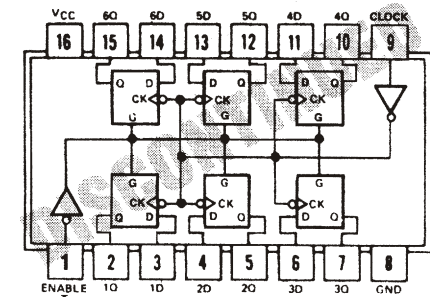

Octal "D" Flip-Flop with 3-State Output
* DISCONTINUED

Diag. 202 20-Pin DIP See Fig. D12
ECG74HC377, ECG74LS377*

Octal "D" Flip-Flop with Common Enable
* DISCONTINUED

Diag. 203 16-Pin DIP See Fig. D8
ECG74LS378

Hex "D" Flip-Flop with Common Enable

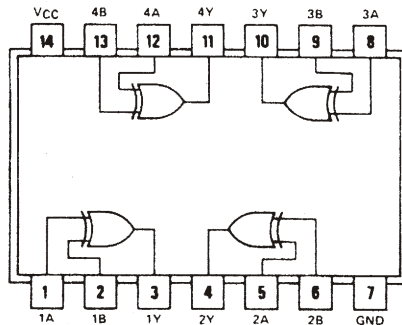

TTL Logic Diagrams (cont'd)

Diag. 204 16-Pin DIP See Fig. D8
ECG74LS379

Quad "D" Flip-Flop with Complementary Outputs

Diag. 205 14-Pin DIP See Fig. D6
ECG74LS386

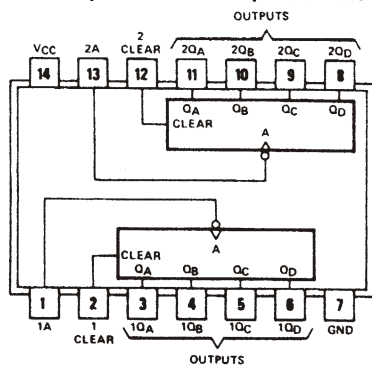

Quad Exclusive OR Gate

Diag. 206 16-Pin DIP See Fig. D8
ECG74HC390, ECG74LS390

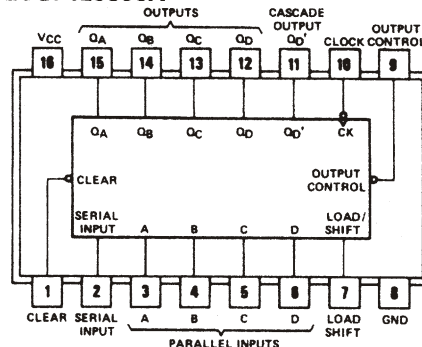

Dual Decade Counter

Diag. 207 14-Pin DIP See Fig. D6
ECG74393, ECG74HC393, ECG74LS393

Dual 4-Bit Binary Counter

Diag. 208 16-Pin DIP See Fig. D8
ECG74LS395A

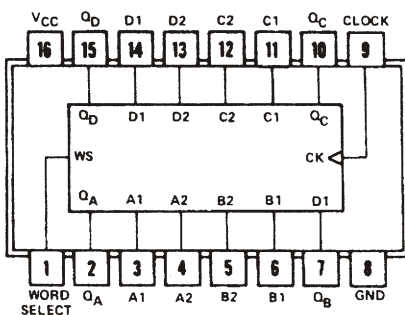

4-Bit Cascadable Parallel Shift Register with 3-State Output

Diag. 209 20-Pin DIP See Fig. D12
ECG74LS398

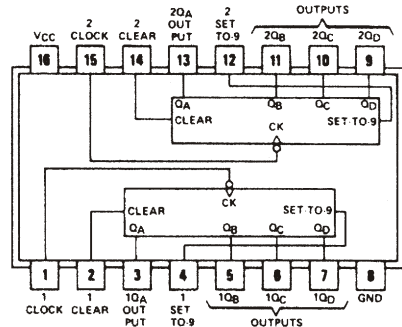

Quad 2-Input Multiplexer with Storage Complementary Outputs

Diag. 210 16-Pin DIP See Fig. D8
ECG74LS399

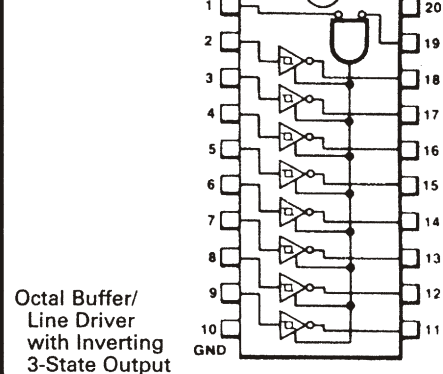

Quad 2-Input Multiplexer with Storage

Diag. 211 16-Pin DIP See Fig. D8
ECG74490, ECG74LS490

Dual Decade Counter

Diag. 212 20-Pin DIP See Fig. D12
ECG74LS540

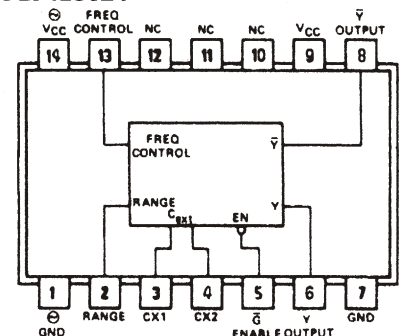

Octal Buffer/Line Driver with Inverting 3-State Output

Diag. 213 20-Pin DIP See Fig. D12
ECG74LS541

Octal Buffer/Line Driver with Non-Inverting 3-State Output

Diag. 214 14-Pin DIP See Fig. D6
ECG74LS624

Voltage Controlled Oscillator with Complementary Output

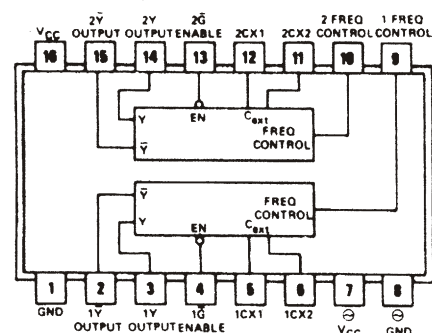

Diag. 215 16-Pin DIP See Fig. D8
ECG74LS625

Dual Voltage Controlled Oscillator with Complementary Output

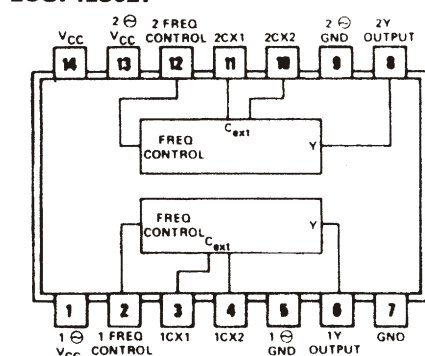

TTL Logic Diagrams (cont'd)

Diag. 216 16-Pin DIP See Fig. D8
ECG74LS626

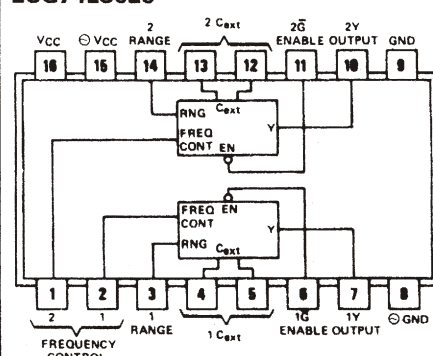

Dual Voltage Controlled Oscillator with Complementary Output and Enable

Diag. 217 14-Pin DIP See Fig. D6
ECG74LS627

Dual Voltage Controlled Oscillator

Diag. 218 16-Pin DIP See Fig. D8
ECG74LS629

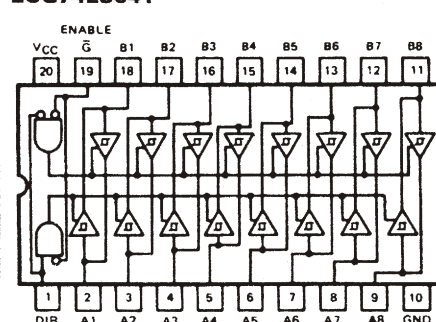

Dual Voltage Controlled Oscillator with Enable

Diag. 219 20-Pin DIP See Fig. D12
ECG74LS640

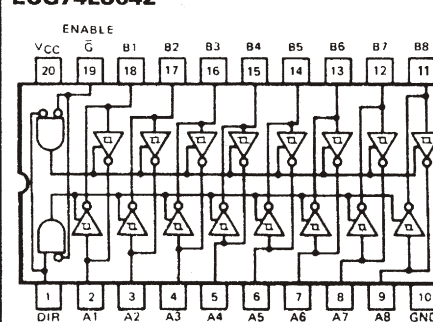

Octal Bus Transceiver with Inverting 3-State Output

Diag. 220 20-Pin DIP See Fig. D12
ECG741 S641

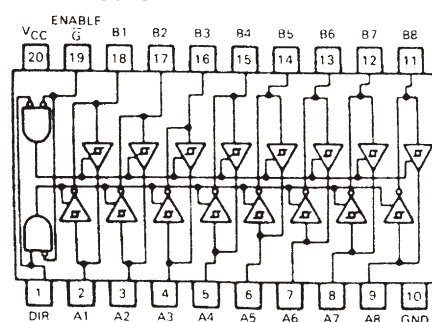

Octal Bus Transceiver with Non-Inverting 3-State Open Collector Output

Diag. 221 20-Pin DIP See Fig. D12
ECG741 S642

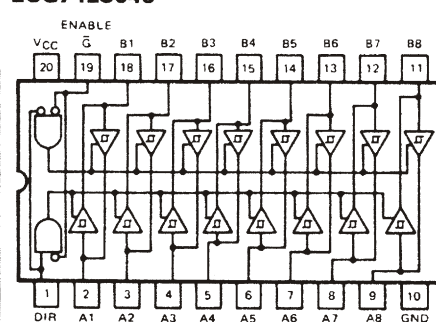

Octal Bus Transceiver with Inverting Open Collector Output

Diag. 222 20-Pin DIP See Fig. D12
ECG74LS643

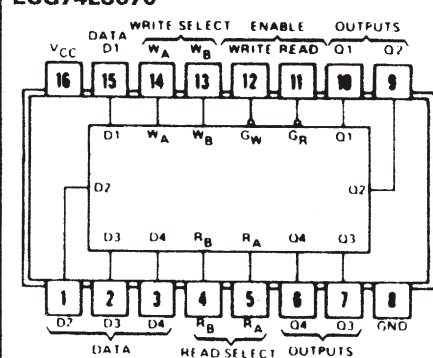

Octal Bus Transceiver with Inverting and Non-Inverting 3-State Output

Diag. 223 20-Pin DIP See Fig. D12
ECG741 S645

Octal Bus Transceiver with Non-Inverting 3-State Output

Diag. 224 16-Pin DIP See Fig. D8
ECG741 S670

4 x 4 Register File with 3-State Output

Diag. 225 14-Pin DIP See Fig. D6
ECG74C901

Hex CMOS to TTL Interface Buffer (Inverting Output)

Diag. 226 14-Pin DIP See Fig. D6
ECG74C902

Hex CMOS to TTL Interface Buffer (Non-Inverting Output)

Diag. 227 14-Pin DIP See Fig. D6
ECG74C903

Hex PMOS to TTL/CMOS Interface Buffer
(Inverting Output)

TTL Logic Diagrams (cont'd)

Diag. 229 18-Pin DIP See Fig. D10
ECG74C922

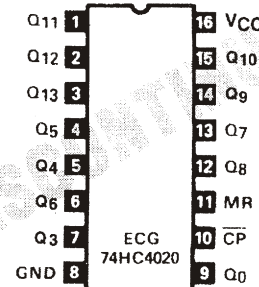

16-Key Keyboard Encoder with 3-State Output

Diag. 230 20-Pin DIP See Fig. D12
ECG74C923

20-Key Keyboard Encoder with 3-State Output

Diag. 232 16-Pin DIP See Fig. D8
ECG74HC4020

14-Stage Binary/Ripple Counter

Diag. 233 16-Pin DIP See Fig. D8
ECG74HC4040

12-Stage Binary/Ripple Counter

Diag. 234 16-Pin DIP See Fig. D8
ECG74HC4053

Triple 2-Channel Analog Multiplexer

Diag. 235 16-Pin DIP See Fig. D8
ECG74HC4060

14-Stage Ripple-Carry Binary Counter/Divider and Oscillator

Diag. 236 24-Pin DIP See Fig. D15
ECG74HC4067

16-Channel Multiplexer/Demultiplexer

Diag. 237 16-Pin DIP See Fig. D8
ECG74HC40105

4-Bit x 16-Word FIFO Register

Diag. 238 16-Pin DIP See Fig. D8
ECG80C95

Hex Buffer with 3-State Output (Common Enable)

Diag. 239 16-Pin DIP See Fig. D8
ECG80C96

Hex Inverter/Buffer with 3-State Output (Common Enable)

Diag. 240 16-Pin DIP See Fig. D8
ECG80C97

Hex Buffer with 3-State Output (2-Line/4-Line Enable)

Diag. 241 14-Pin DIP See Fig. D6
ECG8092

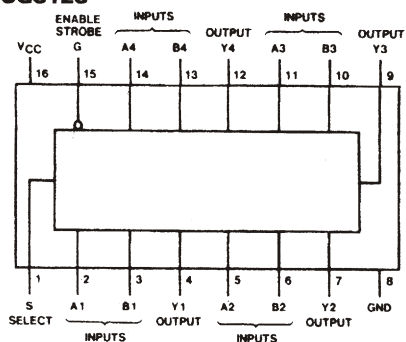

Dual 5-Input NAND Gate

TTL Logic Diagrams (cont'd)

Diag. 242 16-Pin DIP See Fig. D8

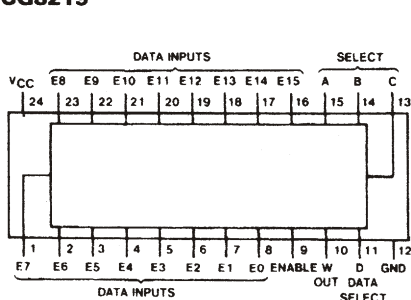

ECG8123

Quad 2-Line-to-1-Line Data Selector/
Multiplexer with 3-State Output

ECG8266

Quad 2-Line-to-1-Line Data Selector/
Multiplexer with Conditional Outputs

Diag. 248 16-Pin DIP See Fig. D8

ECG8301

BCD-to-Decimal Decoder

Diag. 249 24-Pin DIP See Fig. D15

(See Also Diag. 269)

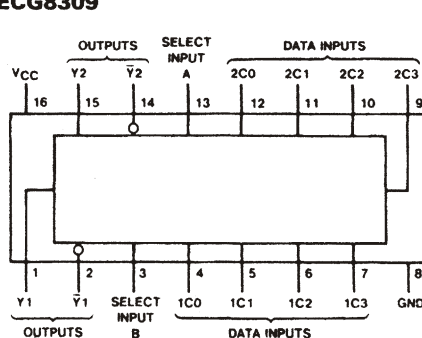

ECG8308

Dual 4-Bit Latch

Diag. 250 16-Pin DIP See Fig. D8

ECG8309

Dual 4-Line-to-1-Line Data Selector/
Multiplexer with Complementary Output

Diag. 251 16-Pin DIP See Fig. D8

ECG8314

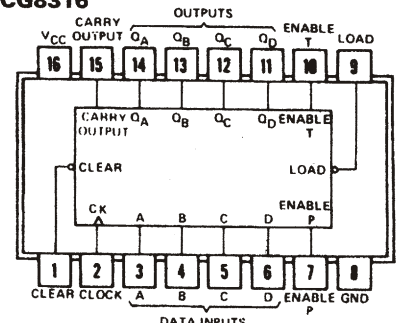

Quad Latch

Diag. 252 16-Pin DIP See Fig. D8

(See Also Diag. 270)

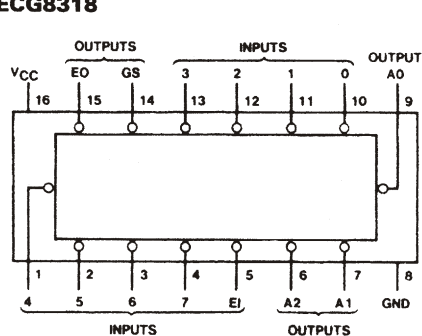

ECG8316

Presettable Synchronous 4-Bit Binary
Counter with Direct Clear

Diag. 253 16-Pin DIP See Fig. D8

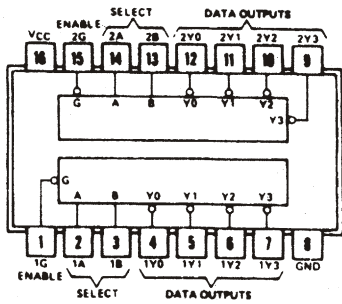

ECG8318

8-Line-to-3-Line Priority Encoder

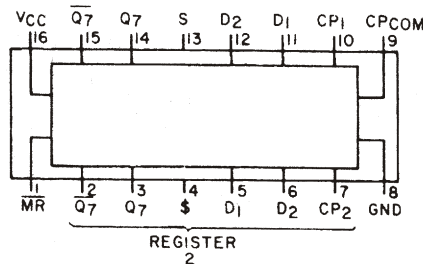

TTL Logic Diagrams (cont'd)

Diag. 254 16-Pin DIP See Fig. D8
ECG8321

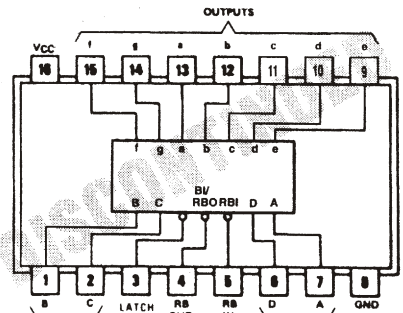

Dual 2-Line-to-4-Line Decoder/Demultiplexer

Diag. 255 16-Pin DIP See Fig. D8
ECG8328

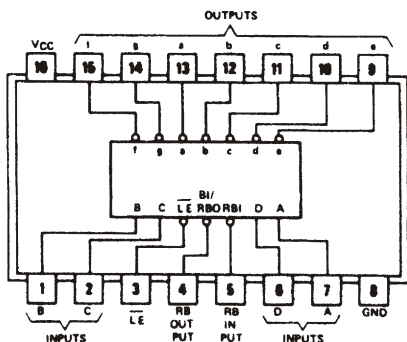

Dual 8-Bit Serial Shift Register

Diag. 257 16-Pin DIP See Fig. D8
ECG8370

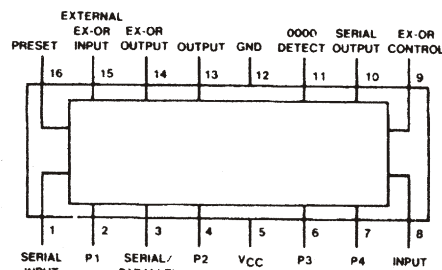

Hexadecimal-to-7-Segment Decoder/Latch/Driver with Open Collector Output

Diag. 258 16-Pin DIP See Fig. D8
ECG8374

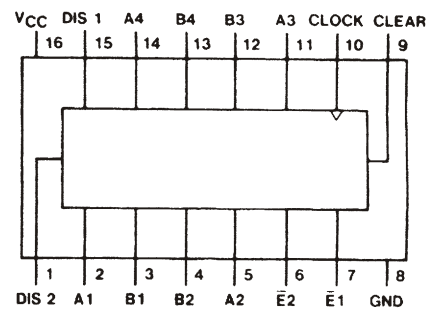

Hexadecimal-to-7-Segment Decoder/Driver/Latch for Common Anode Displays

Diag. 259 16-Pin DIP See Fig. D8
ECG8520

Module "N" Divider

Diag. 260 16-Pin DIP See Fig. D8
ECG8542

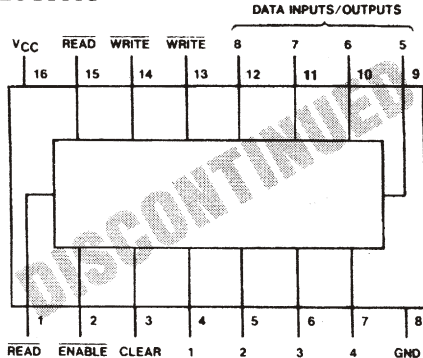

Quad I/O Register with 3-State Output

Diag. 261 16-Pin DIP See Fig. D8
ECG8546

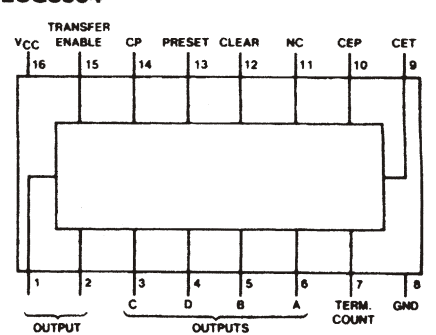

8-Bit Bidirectional I/O Shift Register with 3-State I/O Lines

Diag. 263 16-Pin DIP See Fig. D8
ECG8553

8-Bit Latch with 3-State I/O Lines

Diag. 264 16-Pin DIP See Fig. D8
ECG8554

Synchronous 4-Bit Binary Counter/Latch with 3-State Output

Diag. 266 16-Pin DIP See Fig. D8
ECG8556

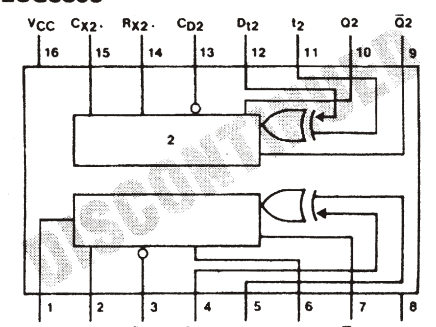

Presettable Synchronous 4-Bit Binary Counter with 3-State Output

Diag. 267 16-Pin DIP See Fig. D8
ECG8613

Quad Gated "D" Flip-Flop

Diag. 268 16-Pin DIP See Fig. D8
ECG8853

Dual Retriggerable/Resettable Monostable Multivibrator with Delay

TTL Logic Diagrams (cont'd)
